For windows go to

https://www.mongodb.com/try/download/community
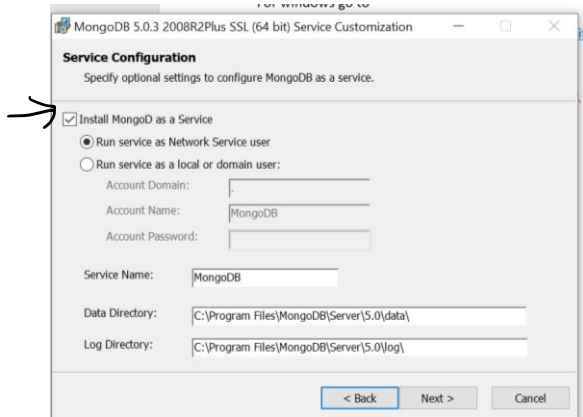

Select MongoDB Community Server -> download msi package of current version, Windows platform

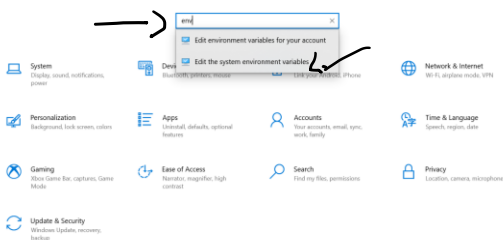

Once installed, we must create a directory were mongoBD is going to store our data

Open file manager -> go to disk were mongoDB is stored ->create data folder-> db folder inside it

Powershell run mongod.exe -> in order to be able to run mongo.db from everywhere I am going to set the path of the aforementioned file to a windows environmental variable

Go to windows settings

System properties-> advanced-> environment variables

System variables-> select "path" ->edit-> new-> add path of exe file mine is (C:\Program Files\MongoDB\Server\5.0\bin)

Then open powershell and execute-> mongod.exe
